## WHAT ARE WE FUELED BY?

We are proud to say that almost 80% of the electricity we supplied last year came from certified renewable energy sources, mostly from solar and wind.

**Overall our fuel mix for the period between April 2018 and March 2019 was 79% green**

The figures below provide a breakdown of our fuel mix and the UK average:

We are delighted to be able to say that we are greener than the UK average, but we are committed to respecting the environment and will continue to procure power from sustainable sources until we can say we are 100% renewable.

## Less environmental impact for a better future

The environmental impact of sourcing the electricity we have supplied to you within this period has been well below the national average as you can see below:

	Carbon Dioxide Emissions (g/kWh)	High-Level Radioactive Waste (g/kWh)
UK National Average	208.0	0.0013
ElectroRoute	74.0	0.0003

This fuel mix information is provided in accordance with Electricity Supply Licence Condition 21, which has been implemented by the Electricity (Fuel Mix Disclosure) Regulations 2005 to give effect to article 3(6) of the EU Electricity Directive (2003/54/EC).
